

Canandaigua Lake Water Quality Update for August 16, 2019

With the calm winds and hot temperatures today we are starting to get additional reports of surface streaking and significant dots in the water both along the shoreline area and in the middle of the lake. Conditions today and through the weekend are ripe for additional concentrations of algae and there is a likelihood of more extensive blooms.

Remember: Use visual cues to identify potential harmful algae blooms. They can appear like pea soup, spilled paint, globs, and parallel surface streaks. Visit the [DEC photo gallery](#) for examples.

If you see anything suspicious, avoid it. Remember that dogs are also susceptible to harmful algae blooms and should not enter the water in suspicious bloom areas.

If you see something that looks like bloom, please send photos and a description to HABS@canandaigualakeassoc.org.

2019 Shoreline HABs Monitoring Program

Twenty-nine trained volunteers around Canandaigua Lake will be reporting current water conditions from August through the beginning of October. While it is not possible to document every bloom occurring on the lake in real time, trained observer reports help us bring you the most up to date information available.
